Sir:

PRELIMINARY AMENDMENT

Prior to calculation of the filing fee and in order to place the above identified application in better condition for examination, please amend as follows:

IN THE SPECIFICATION

Page 1, after the title insert the following:

-- This application is the US national phase of international application PCT/GB00/03970 filed October 16, 2000 which designated the U.S. --.

IN THE CLAIMS

Please substitute the following amended claims for corresponding claims previously presented. A copy of the amended claims showing current revisions is attached.

3. (Amended) A mobile interface device according to Claim 1, wherein the user interface (11, 21) is responsive to an output (51) by the physical detector (50) indicative of ambient noise in the vicinity of said user, to make a compensatory adjustment to output by the audio output means (61).

4. (Amended) A mobile interface device according to Claim 1, wherein the physical detector (50) further comprises means (57, 58, 59) to detect location attributes of said user.

6. (Amended) A mobile interface device according to Claim 4, including a store (64) for storing predetermined information corresponding to one or more location attributes detectable by the physical detector (50), and wherein the user interface (11, 21) is arranged to adjust output by the visual display means (60) and/or the audio output means (61) in dependence upon an output (51) by the physical detector (50) relating to location of said user and to corresponding information stored in said store (64).

8. (Amended) A mobile teleconferencing apparatus comprising a mobile interface device according to Claim 1.

REMARKS

Attached hereto is a marked-up version of the changes made to the claims by the current amendment. The attached page is captioned "**Version with markings to show changes made.**"

The above amendments are made to place the claims in a more traditional format.

Respectfully submitted,

NIXON & VANDERHYE P.C.

VERSION WITH MARKINGS TO SHOW CHANGES MADE

3. (Amended) A mobile interface device according to Claim 1 [or Claim 2],
wherein the user interface (11, 21) is responsive to an output (51) by the physical
detector (50) indicative of ambient noise in the vicinity of said user, to make a
compensatory adjustment to output by the audio output means (61).
4. (Amended) A mobile interface device according to [any one of claims 1 to 3]
Claim 1, wherein the physical detector (50) further comprises means (57, 58, 59) to
detect location attributes of said user.
6. (Amended) A mobile interface device according to Claim 4 [or Claim 5],
including a store (64) for storing predetermined information corresponding to one or
more location attributes detectable by the physical detector (50), and wherein the user
interface (11, 21) is arranged to adjust output by the visual display means (60) and/or
the audio output means (61) in dependence upon an output (51) by the physical
detector (50) relating to location of said user and to corresponding information stored in
said store (64).
8. (Amended) A mobile teleconferencing apparatus comprising a mobile
interface device according to [any one of the preceding claims] Claim 1.

JC10 Rec'd PCT/PTO 18 MAR 2002

PERSONAL MOBILE COMMUNICATION DEVICE

This invention relates to a device in which the user interface of a mobile personal device is modified according to physical and location context. In particular

5 this invention relates to a mobile teleconferencing device. In a telecommunications conferencing (teleconferencing) facility images are generated relating to a "virtual meeting space". Individuals at a plurality of locations remote from each other, and accessing the facility using different types of access device may interact with each other in a manner which emulates a conventional meeting. When the user is using a

10 teleconferencing facility the physical and location attributes may be used to modify a representation of the user. The detected physical and location attributes may also be used to modify the interface of the teleconferencing device.

Individual users are represented in the virtual meeting space display by

15 computer-generated representations of the users, known as "avatars" (or "icons"). These may be derived from video images of the users, either live or retrieved from a store, but usually they are digitally generated representations. In general, each user is able to select the appearance of his or her avatar in the virtual space from a menu of characteristics. Alternatively, each individual user may be able to select, for his

20 own viewpoint, how each of the other users' avatars will appear. Other characteristics of the meeting space, such as the colour and shape of the elements of the meeting space, may also be selectable by the user.

According to the present invention there is provided a mobile interface device for

25 accessing a computer, comprising:

a user interface having visual display means and audio output means; and
a physical detector for detecting attributes indicative of the physical context
of a user of the device;

wherein the user interface is responsive to an output of the physical detector

30 in respect of said user to make a corresponding adjustment to output by the visual display means and/or the audio output means.

In a preferred embodiment the user interface is responsive to an output of the physical detector indicating that said user is not substantially stationary, to inhibit output by the visual display means.

- 5 In a further preferred embodiment, the physical detector further comprises means to detect location attributes of said user and, for example, the physical detector is arranged to detect when said user is located within a building.

Preferably the output of the audio output device is dependent upon the location
10 attributes of the user, and preferably the output of the visual display device is
dependent upon the location attributes of the user.

According to the invention there is also provided a mobile teleconferencing apparatus comprising such a mobile interface device.

15

An embodiment of the invention will now be described by way of example only with reference to the accompanying drawings, in which:

Figure 1 shows a network with human/machine interface units serving teleconference users via respective client apparatuses;

- 20 Figure 2 is a representation of a teleconference as displayed on an interface unit of Figure 1;

Figure 3a is a block diagram showing a client apparatus of Figure 1 which incorporates a physical and location sensor;

Figure 3b is a functional block diagram showing the logical operation of the apparatus shown in Figure 3a; and

Figures 4 to 7 are examples of representations of a user as shown on an interface unit of Figure 1, in which the representation of the user is dependent upon location and physical data collected using the apparatus shown in Figure 3a.

30 Figure 1 shows a network serving four users 1, 2, 3, 4 (not shown) allowing them to interact in a virtual teleconference. Each user has a respective human/machine interface unit 21, 22, 23, 24, which includes video and/or audio equipment for the user to

CLAIMS

1. A mobile interface device for accessing a computer (10), comprising:
 - a user interface (11, 21) having visual display means (60) and audio output means (61); and
 - a physical detector (50) for detecting attributes indicative of the physical context of a user of the device;
 - wherein the user interface (11) is responsive to an output (51) of the physical detector (50) in respect of said user to make a corresponding adjustment to output by the visual display means (60) and/or the audio output means (61).
 2. A mobile interface device according to Claim 1, wherein the user interface (11, 21) is responsive to an output of the physical detector (50) indicating that said user is not substantially stationary, to inhibit output by the visual display means (60).
16
 3. A mobile interface device according to Claim 1 or Claim 2, wherein the user interface (11, 21) is responsive to an output (51) by the physical detector (50) indicative of ambient noise in the vicinity of said user, to make a compensatory adjustment to output by the audio output means (61).
20
 4. A mobile interface device according to any one of claims 1 to 3, wherein the physical detector (50) further comprises means (57, 58, 59) to detect location attributes of said user.
25
 5. A mobile interface device according to Claim 4, wherein the physical detector (50) is arranged to detect when said user is located within a building.
 6. A mobile interface device according to Claim 4 or Claim 5, including a store (64) for storing predetermined information corresponding to one or more location attributes detectable by the physical detector (50), and wherein the user interface
30

(11, 21) is arranged to adjust output by the visual display means (60) and/or the audio output means (61) in dependence upon an output (51) by the physical detector (50) relating to location of said user and to corresponding information stored in said store (64).

5

7. A mobile interface device according to Claim 6, wherein said predetermined information identifies a corresponding location type and wherein the user interface (11, 21) is responsive to an identified location type to output a corresponding alert at the audio output means (61).

10

8. A mobile teleconferencing apparatus comprising a mobile interface device according to any one of the preceding claims.

1

MOBILE PERSONAL DEVICE

This invention relates to a device in which the user interface of a mobile personal device is modified according to physical and location context. In particular this invention
5 relates to a mobile teleconferencing device. In a telecommunications conferencing (teleconferencing) facility images are generated relating to a "virtual meeting space". Individuals at a plurality of locations remote from each other, and accessing the facility using different types of access device may interact with each other in a manner which emulates a conventional meeting. When the user is using a teleconferencing facility the
10 physical and location attributes may be used to modify a representation of the user. The detected physical and location attributes may also be used to modify the interface of the teleconferencing device.

Individual users are represented in the virtual meeting space display by
15 computer-generated representations of the users, known as "avatars" (or "icons"). These may be derived from video images of the users, either live or retrieved from a store, but usually they are digitally generated representations. In general, each user is able to select the appearance of his or her avatar in the virtual space from a menu of characteristics. Alternatively, each individual user may be able to select, for his own
20 viewpoint, how each of the other users' avatars will appear. Other characteristics of the meeting space, such as the colour and shape of the elements of the meeting space, may also be selectable by the user.

According to the present invention there is provided a human computer interface device
25 comprising a user interface device comprising a visual display device and an audio output device; and a physical detector for detecting physical attributes of a user; in which the visual display device is arranged to inhibit output via the visual display device when the user is not stationary.

30 In a preferred embodiment the device further comprises a location detector for detecting location attribute of the user and in which the operation of the user interface device dependent upon the detected location attributes of the user.

Preferably the output of the audio output device is dependent upon the location attributes of the user, and preferably the output of the visual display device is dependent upon the location attributes of the user.

- 5 According to another aspect of the invention there is provided a human computer interface device comprising a user interface device comprising a visual display device and an audio output device; a physical detector for detecting physical attributes of a user; and a location detector for detecting location attributes of the user and in which the operation of the user interface device dependent upon the detected location attributes of the user.

10

Preferably the output of the audio output device is dependent upon the location attributes of the user, and preferably the output of the visual display device is dependent upon the location attributes of the user.

15

- According to the invention there is also provided a mobile conferencing device including such a human computer interfacing device.

An embodiment of the invention will now be described by way of example only with reference to the accompanying drawings, in which:

20

Figure 1 shows a network with human/machine interface units serving teleconference users via respective client apparatuses;

Figure 2 is a representation of a teleconference as displayed on an interface unit of Figure 1;

25

Figure 3a is a block diagram showing a client apparatus of Figure 1 which incorporates a physical and location sensor;

Figure 3b is a functional block diagram showing the logical operation of the apparatus shown in Figure 3a; and

Figures 4 to 7 are examples of representations of a user as shown on an interface unit of

30

Figure 1, in which the representation of the user is dependent upon location and physical data collected using the apparatus shown in Figure 3a.

Figure 1 shows a network serving four users 1, 2, 3, 4 (not shown) allowing them to interact in a virtual teleconference. Each user has a respective human/machine interface unit 21, 22, 23, 24, which includes video and/or audio equipment for the user to

see and/or hear what is happening in the virtual meeting space. The interface unit includes user input devices (e.g. audio input, keyboard or keypad, computer "mouse" etc.) to enable the user to provide input to the virtual meeting space. Each interface unit, 21, 22, 23, 24 is connected to a respective client apparatus 11, 12, 13, 14 which provides an interface between the user and a main server 10 which controls the operation of the meeting space. The server 10 has, as a further input, a virtual reality (VR) definition store 30 which maintains permanent data defining the virtual meeting space (also referred to as the meeting space definition unit in the specification). The control of the meeting space is carried out by interaction between the client apparatuses 11, 12, 13, 14 and the server 10.

10 The display control functions may take place in the server 10, or the display control functions may be distributed in the client apparatus 11, 12, 13, 14, depending on the functionality available in the client apparatus. Links between the client apparatus 11, 12, 13, 14 and the server 10 may be permanent hard-wired connections, virtual connections (permanent as perceived by the user, but provided over shared lines by the telecommunications provider), or dial-up connections (available on demand, and provided on a pay-per-use basis), and may include radio links, for example to a mobile device. The server 10 may have, in addition to the server functionality, similar functionality to the client apparatus 11, 12, 13, 14, but as shown the server 10 is dedicated to the server function only.

20

An example of an image representing a meeting space as it appears on a display device is shown in Figure 2. In this example, users 2, 3 and 4 are represented by avatars 42, 43 and 44 respectively.

25

Referring again to Figure 1, in response to inputs from one of the users (e.g. user 1) through his respective user interface 21 the client apparatus 11 transmits these inputs to the main server 10 which, in accordance with the meeting space definition unit 30, controls the images to be represented on the other users' screens in the human machine interface units 22, 23, 24 to represent the activities of the user 1, input through interface device 21. As a very simple example, the actions of the user 1 when first establishing contact with the meeting space are translated by the client apparatus 11 and converted by the server 10, into a representation of the user 1 entering the meeting space, which is in turn passed to the individual clients 12, 13, 14 to be represented as the avatar of the user 1 moving into the field of view of the display devices 22, 23, 24.

35

The manner of representation of the individual user 1 in the virtual space, for example the appearance of the avatar in terms of age, sex, hair colour etc may be selected either by the user 1 through his respective client device 11, or by each receiving user 2, 3, 4 in the meeting space, who may each select an avatar according to his own requirements to represent the user 1. Similarly, some parts of the virtual meeting space may be defined centrally in the meeting space definition unit 30, whereas other aspects may be defined by each individual client apparatus 11, 12, 13, 14 independently of the others. Such definitions may include colour schemes, the relative locations in the virtual meeting space of the individual users 1, 2, 3, 4, etc.

10

The client apparatus 11 is a mobile device, and in the embodiment of the invention described here the mobile device 11 is a wireless palmtop computer. In this specification the term mobile device is intended to refer to all computing devices which may be carried around or worn by a user, and may be used whilst the user is moving around and active in other tasks. Mobile devices are distinguished from portable devices which are carried to a location and then used whilst the user is stationary.

However, a mobile device may or may not have visual display capabilities. Even if the device does have such capabilities, the user 1 may be walking or running or otherwise distracted, and may not be able to attend to a visual display. The representation of the user 1 is displayed to the other users 2, 3, 4 as shown in Figure 4, so that the other users are aware that user 1 is on line, but that the user 1 may not have a visual link to the teleconference.

For users using a mobile device there are other aspects of the service to consider beside the fact that the client device 11 may not have as sophisticated input and output capabilities as other client devices 12, 13, 14 . Privacy may be an issue. It is possible that other people might move in and out of the user's proximity during a conversation. In order to make the other users in a conference aware of potential privacy issues the user's avatar is changed as shown in Figure 5 to indicate that the user is on line, but that the user may not be in private. The user 1 can indicate that there is a privacy issue manually, by transmitting a signal via the client 11 to the server 10 using a predetermined key or sequence of keys. The device 11 has an audio input, and as an alternative to using a manually entered key or sequence of keys to indicate the user is not in private, the received audio signal is analysed, using known speaker recognition algorithms, to

- determine whether speech other than that from the user is detected. The device 11 may also be equipped with a video input, in which case the video signal received via the video input can be analysed using known image classification algorithms, for example to detect whether there is skin detected in the captured image, or to detect the number of faces in the
- 5 captured image. The results of such image classification may then be used to indicate to the server 10 that the user is not in private and the user's avatar is modified accordingly.

Another issue which is relevant to mobile users using radio links to access the virtual meeting space is Quality of Service (QoS). The fixed telephony network uses

10 64Kbits/s per voice channel while the mobile network uses 9.6 Kbits/s per voice channel. The average number of bits per second transmitted from the client device 11 to the server 10 is monitored by the server 10. The avatar of the user 1 is modified to be more or less opaque as a function of the average number of bits per second received by the server 10 from the client device 11. Hence the opacity of the avatar representing the user 1 related

15 to the QoS as perceived by other users 2, 3, 4. In this embodiment of the invention the more opaque the avatar the better the perceived QoS.

For a mobile user, the attention paid to the virtual meeting space varies in dependence upon the 'real world' task currently being carried out. For example, whilst

20 travelling on a train a user may be required to show a ticket to the ticket inspector, or somebody may speak to the user to ask the time. If the user is walking, running, or unable to remain still for some reason, then the attention paid to the virtual meeting space will be more limited than otherwise. If the user is in a noisy environment, again, the attention paid to the virtual meeting space will be less than it would be in a very quiet environment.

25 Detection of a user's physical and location attributes is discussed in more detail with reference to Figure 3a and 3b.

The audio environment is analysed using the audio signal received via the audio input on the client apparatus 11. It is also possible for the user to use a predetermined key

30 or sequence of keys to indicate via the client apparatus 11 to the server 10 that he is distracted or on the move. Figure 6 shows a representation of a user who is on-line but distracted, and Figure 7 shows a representation of a user who is on line but on the move.

The user interface unit 21 includes a physical and location sensor 50 as shown in Figure

35 3, as well as a visual display 60 and an audio input/output device 61. The physical and

- location sensor 50 is connected to the client apparatus 11 by a serial interface 51. A low acceleration detector 52 measures acceleration of a low force in two directions using an ADXL202. A high acceleration detector 53 measures acceleration of a high force in three directions using an ACH04-08-05 available from Measurement Specialities Incorporated
- 5 (which can be referenced via Universal Resource Locator (URL) <http://www.msiusa.com> on the Internet). A direction detector 54 is provided using a compass which gives an absolute measurement of orientation of the client apparatus. A HMC2003, available from Honeywell (URL <http://www.ssechoneywell.com>), is used. The compass is a three-axis magnetometer sensitive to fields along the length, width and height of the device. A
- 10 direction and velocity detector 55 is provided using an ENC Piezoelectric Vibrating Gyroscope (part number S42E-2 which is sold under the registered trademark GYROSTAR) available from Murata manufacturing Company Ltd. (URL <http://www.murata.com>). The gyroscope measures angular velocity, giving speed and direction in two directions in each axis of rotation (i. e. six measurements are provided).
- 15 The acceleration detectors 52, 53, the direction detector 54 and the velocity and direction detector 55 are connected via a multiplexer (MUX) 56 to a microcontroller 57 where the outputs are analysed as will be described later.

A global position detector 58 is provided which measures the absolute location of

20 the device using a Global Positioning System (GPS) receiver which receives signal from GPS satellites.

GPS provides specially coded satellite signals that can be processed in a GPS receiver, enabling the receiver to compute position, velocity and time. The nominal GPS

25 Operational Constellation consists of 24 satellites that orbit the earth twice a day, 11,000 miles above the earth. (There are often more than 24 operational satellites as new ones are launched to replace older satellites.) The satellite orbits repeat almost the same ground track (as the earth turns beneath them) once each day. There are six orbital planes (with nominally four satellites in each), equally spaced (60 degrees apart), and

30 inclined at about fifty-five degrees with respect to the equatorial plane. This constellation provides the user with from five to eight satellites visible from any point on the earth. The GPS satellites orbit the earth transmitting their precise position and elevation. A GPS receiver acquires the signal, then measures the interval between transmission and receipt of the signal to determine the distance between the receiver and the satellite. Once the

receiver has calculated this data for at least 3 satellites, its location on the earth's surface can be determined.

The receiver used in this embodiment of the invention is a Garmin GPS35 unit
5 (available, for example from Lowe Electronics Ltd in the UK). GPS signals do not propagate inside buildings so a local position detector 59 is also provided which uses local area beacons (LAB's) (not shown) which use low power 418MHz AM radio transmitters (such as the CR91Y, CR72P, CR73Q or CR74R from RF Solutions) at known locations within a building. Radio or infrared transmitters could be used, although radio provides a
10 more robust solution since line of sight connections are not required.

Once the "Bluetooth" radio based system becomes available this will also provide a suitable solution. Bluetooth is a standard for wireless connectivity, designed to replace cables between portable consumer devices such as cellular phones, laptop computers,
15 personal digital assistants, digital cameras, and many other products. The Bluetooth version 1.0 specification was agreed in July 1999, and the first products are expected on the market in mid 2000.

Software on the microcontroller 57 gathers sensor data from the detectors 52, 53,
20 54, 55, via the MUX 56 which is configured to read each device in turn via an analogue port. The output from the global position detector 58 is read via a serial port connection and the output from the local position detector 59 is connected to a digital input on the microcontroller 57. Also provided is a location database 64 which is accessed by the
microcontroller 57 to determine location names.

25 Figure 3b is a functional block diagram showing the logical operation of the physical and location detector 50. A location agent 62, implemented in software on the microcontroller 57, uses location data gathered by the global position detector 58 and the local position detector 59, analyses this data and makes the analysis available to the client apparatus
30 11. The location agent 62 also receives information about velocity and direction, measured by the direction detector 54 and the velocity and direction detector 55, from a physical agent 63. The physical agent is also implemented in software in the microcontroller 57.

The location agent determines whether GPS is available, and whether the global location measured by the global position detector 58 is based on a signal from three or more satellites. The local position detector 59 detects signals from LAB's, each of which has a unique identifier. The location agent 62 accesses the location database 64 to 5 determine a location name associated with a received LAB identifier. The location agent 62 must be able to determine the following:

- Is the device inside or outside? If less than three GPS signals are received then the device is determined to be inside.
- 10 • Is the device moving? A measured velocity from the global position detector 58 (if the device is outside) and velocity measured via the physical agent 63 are used to determine whether the device is moving.
- Location of the device. Latitude and longitude, if the device is outside, are measured via the global position detector 58 and/or a location name is determined using the local 15 position detector 59 and the location database 64.
- Direction of movement. This may be determined by the global position detector and /or by direction data received from the physical agent.

The physical agent 63 analyses physical sensor data and makes this available to 20 the location agent 62. The physical agent is used to determine the following user attributes.

- Standing.
 - Walking.
 - 25 • Sitting.
 - Cadence (velocity).
 - Acceleration.
 - Shock.
- 30 The complex nature of the physical data makes the use of simple rules unreliable. The physical agent 63 of this embodiment of the invention uses Hidden Markov Models (HMM) to provide a determination above based on the inputs from the detectors 52, 53, 54, 55, 56. A good description of an implementation of HMM's (as applied to speech recognition, but the principles are the same) may be found in "Hidden Markov Models for Automatic

"Speech Recognition: Theory and Application" S.J. Cox, British Telecom Technology Journal Vol. 6, No. 2, April 1988. In other embodiments of the invention it is possible for the physical agent to analyse visual and audio information received from the visual and audio input/output device provided as part of the interface unit 21.

5

The client apparatus 11 has the physical information made available to it via the physical agent 63, and the location information made available to it via the location agent 62. Audio and/or visual information is used on the mobile device to provide the user with information alerts, and for teleconferencing activity. Spatial audio is also used for 10 information alerts and for spatialised teleconferencing, which appears more natural to the user.

The interface used by the device for information alerts, and the interface used for teleconferencing are dependent on the user's current location and physical context (i. e. is 15 the user standing/ walking/sitting etc). If the user is unlikely to be able to attend to a visual display, an audio interface is used. If the user is likely to be unavailable (eg running) then the device could divert alerts to a messaging service, which could then alert the user when it is determined he is available again. In embodiments of the invention incorporating audio input and analysis it is also possible to configure the audio output on the user's 20 wearable or handheld device to match the acoustics, ambient noise level etc of the real world space in which the user is located. The nature of the interface used (for example the sound of a mobile device's alert or 'ring-tone') can be modified according to the detected user location. For example, a mobile phone handset could use a ring-tone such as a voice saying "shop at the Harrods' sale" if it is determined by the location agent 62 that the user 25 is walking along Knightsbridge (where the famous shop 'Harrods' is located). A phone could use an appropriate piece of music if it is determined by the location agent 62 that the user is in church. Similarly to changing the users' audio interface in dependence on the detected location, the visual display can be altered according to the determined location. The screen style of the visual interface can be made to reflect the theme of the 30 location. For example if the user is viewing web pages, and is walking around a museum, the web pages viewed as the user moves to different locations change to reflect the area of the museum.

In embodiments of the invention including the analysis of visual and audio 35 information received from a visual and audio input/output device provided as part of the

interface unit 21, it is possible to use standard speech and video analysis algorithms to provide a more sophisticated interface to the user. There are standard algorithms for identifying speech within an audio stream so it would be possible to make a mobile phone handset that auto diverted or changed ring tone if the user is detected to be currently in conversation with someone. Visual information can also be analysed using standard algorithms such as skin detection or face detection and this information can be used along with audio analysis to infer whether the user is likely to be in private, for example.

CLAIMS

1. A human computer interface device comprising
 - a user interface device comprising a visual display device and an audio output device; and
 - a physical detector for detecting physical attributes of a user;
 - in which the visual display device is arranged to inhibit output via the visual display device when the user is not stationary.
- 10 2. A device according to claim 1, further comprising a location detector for detecting location attributes of the user and in which the operation of the user interface device dependent upon the detected location attributes of the user.
- 15 3. A device according to claim 2 in which the output of the audio output device is dependent upon the location attributes of the user.
4. A device according to claim 2 or claim 3 in which the output of the visual display device is dependent upon the location attributes of the user.
- 20 5. A human computer interface device comprising
 - a user interface device comprising a visual display device and an audio output device;
 - a physical detector for detecting physical attributes of a user; and
 - a location detector for detecting location attributes of the user and in which the operation of the user interface device dependent upon the detected location attributes of the user.
- 25 6. A device according to claim 5 in which the output of the audio output device is dependent upon the location attributes of the user.
- 30 7. A device according to claim 5 or claim 6 in which the output of the visual display device is dependent upon the location attributes of the user.
8. A mobile conferencing device including a human computer interface device
35 according to any one of the preceding claims.

ABSTRACT
Mobile Conferencing

- 5 A human computer interface device is provided in which the operation of the user interface depends upon detected physical and location attributes of the user. If a user is moving the user interface switches to auditory output only. Detected location attributes are also used to modify the operation of the user interface. Also provided is a mobile conferencing devices incorporating such a human computer interface device. In this case
- 10 the ring-tone or a visual display can be tailored according to the detected location.

RULE 63 (37 C.F.R. 1.63)
DECLARATION AND POWER OF ATTORNEY
FOR PATENT APPLICATION
IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

As a below named inventor, I hereby declare that my residence, post office address and citizenship are as stated below next to my name, and I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled:

MOBILE PERSONAL DEVICE

the specification of which (check applicable box(s)):

- is attached hereto
 was filed on _____

as U.S. Application Serial No.

(Atty Dkt. No. _____)

- was filed as PCT International application No. _____

PCT/GB 00/03970

on 16 OCTOBER 2000

and (if applicable to U.S. or PCT application) was amended on _____

I hereby state that I have reviewed and understand the contents of the above identified specification, including the claims, as amended by any amendment referred to above. I acknowledge the duty to disclose information which is material to the patentability of this application in accordance with 37 C.F.R. 1.56. I hereby claim foreign priority benefits under 35 U.S.C. 119/365 of any foreign application(s) for patent or inventor's certificate listed below and have also identified below any foreign application for patent or inventor's certificate having a filing date before that of the application on which priority is claimed or, if no priority is claimed, before the filing date of this application:

Priority Foreign Application(s):

Application Number	Country	Day/Month/Year Filed
99308195.9	EUROPE	18 OCTOBER 1999

I hereby claim the benefit under 35 U.S.C. §119(e) of any United States provisional application(s) listed below.

Application Number	Date/Month/Year Filed
--------------------	-----------------------

I hereby claim the benefit under 35 U.S.C. 120/365 of all prior United States and PCT international applications listed above or below and, insofar as the subject matter of each of the claims of this application is not disclosed in such prior applications in the manner provided by the first paragraph of 35 U.S.C. 112, I acknowledge the duty to disclose material information as defined in 37 C.F.R. 1.56 which occurred between the filing date of the prior applications and the national or PCT International filing date of this application:

Prior U.S./PCT Application(s):

Application Serial No.	Day/Month/Year Filed	Status: patented
------------------------	----------------------	------------------

PCT/GB00/03970	16 OCTOBER 2000	PENDING
----------------	-----------------	---------

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon. And on behalf of the owner(s) hereof, I hereby appoint **NIXON & VANDERHYE P.C., 1100 North Glebe Rd., 8th Floor, Arlington, VA 22201-4714, telephone number (703) 816-4000 (to whom all communications are to be directed)**, and the following attorneys thereof (of the same address) individually and collectively owner's/owners' attorneys to prosecute this application and to transact all business in the Patent and Trademark Office connected therewith and with the resulting patent: Arthur R. Crawford, 25327; Larry S. Nixon, 25640; Robert A. Vanderhye, 27076; James T. Hosmer, 30184; Robert W. Faris, 31352; Richard G. Besha, 22770; Mark E. Nusbaum, 32348; Michael J. Keenan, 32106; Bryan H. Davidson, 30251; Stanley C. Spooner, 27393; Leonard C. Mitchell, 29009; Duane M. Byers, 33363; Jeffry H. Nelson, 30481; John R. Lastova, 33149; H. Warren Burnam, Jr. 29366; Thomas E. Byrne, 32205; Mary J. Wilson, 32955; J. Scott Davidson, 33489; Alan M. Kagen, 36178; Robert A. Molan, 36663; B. J. Sadoff, 34776; Updeep S. Gill, 37334; Michael J. Shea, 34725; Donald L. Jackson, 41090; Michelle N. Lester, 32331; Frank P. Presta, 19828; Joseph S. Presta, 35329. I also authorize Nixon & Vanderhye to delete any attorney names/numbers no longer with the firm and to act and rely solely on instructions directly communicated from the person, assignee, attorney, firm, or other organization sending instructions to Nixon & Vanderhye on behalf of the owner(s).
